## Space traveler

When I am tired, I will slow down my pace and imagine myself coming to the vast seaside to empty my mind; imagine myself going to the boundless countryside to relax my body and mind. At night, I look up at the starry sky and imagine an indulgent space travel.

Having a view of the North and South Poles and watching countless sunsets and sunrises in a day is not mere imagination. I will experience zero gravity like an astronaut, grow vegetables in space, do live broadcasts, post on social media... such a trip must be very interesting. This is not a delusion, a science fiction, nor a fantasy movie, but a new trend in tourism that has gained a lot of attention lately. This new type of tourism is expected to become a new type of leisure, this includes space travel, space packages, space hotels, etc. .

Space travel is no longer a new term, but a new breakthrough about to emerge. A British private aerospace company has completed a supersonic test flight, a big step towards space travel; the Russian Federal Space Agency plans to invest in the development of space tourism, a fleet of "luxury" space hotels will be launched; a large American corporation introduced a space ship with the "largest window", it even announced the successful launch of a rocket that sent a sports car into space. Their next step is to send humans to Mars.

Although space is mysterious, it is not unreachable. There are currently three space tourism packages to choose from. The first is called subspace high-altitude flight. This allows spacecraft to pass through the atmospheric layer just before outer space, this allows travelers to enjoy a view broadly similar to the view one gets from being in space; their experience is not in any way less than that of astronauts.

The second is a suborbital flight at about 20 to 100 kilometers above the ground, this allows space travelers to experience weightlessness and an aerial view of the earth. The last one is orbital flight, which is at 400 kilometers from the ground. This is the real space flight. Companies providing such advanced tourism services have emerged around the world and they are actively developing the suborbital tourism segment.

According to the news released by China's Xinhua News Agency, the 'Long March' rocket will be launched along with multiple types of services such as "space car", "hitching a lift" and "shuttle bus". When the China Aerospace Science and Technology Corporation released its roadmap, it stated that around 2025, China's suborbital space tourism will become a reality.

In the process of exploring the universe, there are moments of joy and also moments of despair. Once during the research process, a manned spacecraft exploded all of a sudden, causing the death of the test pilots. These accidents have caused the outside world to question the safety of the spacecrafts. Even so, the brave who wanted to make space tourism a reality will not stop, they are willing to trade failures for the eventual success of space travel.

Looking up at the stars and letting your thoughts enter the world of "The Little Prince" and "Star Wars", isn't this a kind of space travel too? After letting our imaginations run wild, we must be be down-to-earth/practical and work hard towards our goals, so as not to waste the encouragement given to us by outer space.

Living in the era of space travel is not so much about admiring the beauty of the vast universe than it is about human beings pushing their limits and realizing the dream that everyone can explore the universe. Compared with individual entertainment, bold imagination and brave attempts are more valuable.

Let us embrace space and become the next travelers to board a space ship!
